

Life Cycle Perspective

- Aspects within our EMS that we have control
- Aspects outside our EMS that we may influence
- Aspects outside the EMS that we cannot influence

We have limited influence of what our customers require. We ensure that from the design to the manufacture, economy of materials and processes are planned for best outcomes of material wastage and power use.

We have limited influence of how some of our products are delivered, due to size and weight, but shipment is evaluated to optimize efficiency. Site work requires the use of vehicles for staff and equipment, but new vehicle purchases are evaluated for latest technology, fuel consumption and size.

Our influence over our suppliers is to use those who are evaluated through the company supplier approval process. Although we cannot influence them directly, we evaluate on an 'on-going' basis.

Before and during the design stage, materials used and economy of manufacture are evaluated to minimise energy used and wastage.
